

Firewall & Router Management

As part of a fully outsourced solution, we work with specialised partners to source, install and manage routers and firewalls on your premises.

What is it?

Any network connection requires a router and/or firewall on your premises to manage traffic and protect you external users.

OneSquared firewall and router management services allow you to outsource the management of these boarder devices in conjunction with our high-speed network services.

Product Features:

- Routers, firewall, and software procurement
- Network and device management
- Web based reporting
- Policy design and implementation
- Monitoring and Reporting
- IP bandwidth management

How does it work?

When you utilise OneSquared Internet or Private Network services, you can also opt to have us provide routers and/or firewalls for each of your locations.

We then implement a standard rule-set on each device and ship it to your various locations, or we can work with you to design and implement a customised policy for the management of your network traffic and security.

On an ongoing basis you can then manage these devices yourself, or have our specialized team do it for a small monthly fee.

Will it suit me?

If you do not have an experienced network management and Internet security team in house, bundling OneSquared firewall and router management services with you network connectivity solution gives you a complete package.
